

AS-IS Process — Proposed ERIC Site-Level Exception Review

Scope statement

This is a proposed case-study workflow, not a documented NHS operational process.

Process

ERIC data becomes available → reviewer accesses data → reviews reported measures → identifies an unusual observation → checks definition/applicability → reviews contextual information → decides whether further investigation is required.

Pain points inferred for the scenario

- Unusual observations depend on reviewer identification.
- Missing values require contextual judgement.
- Site type/context affects interpretation.
- The scenario does not provide an explicit exception reason before investigation.
- Validation may occur during investigation.

End states

No further action OR investigation required / referred.
