

TO-BE Process — Proposed ERIC Site-Level Exception Review

Scope statement

This is a proposed improvement for the independent case study, not an implemented NHS process.

Process

ERIC data available → prepare/refresh → calculate measures → run validation rules → screen potential exceptions → combine exception with context → present exception queue → reviewer investigates → determine action → close or refer.

System responsibilities

- Calculate repeatable measures.
- Apply validation rules.
- Screen potential exceptions.
- Provide explainable flag reasons.
- Present relevant context.

Human responsibilities

- Investigate context.
- Interpret findings.
- Decide whether follow-up is required.
- Record/refer the outcome where an operational process exists.

Improvement principle

Move repeatable validation and screening upstream so human effort is concentrated on contextual investigation and decision-making.
