

Requirements Summary — NHS ERIC 2024/25

Business need

Provide a consistent, explainable way to identify potentially unusual site-level observations and support contextual investigation.

Functional requirements

- FR-01 — Identify site records.
- FR-02 — Calculate finance cost per occupied m².
- FR-03 — Screen potential exceptions.
- FR-04 — Apply validation rules.
- FR-05 — Handle missing values contextually.
- FR-06 — Display relevant context.
- FR-07 — Explain the reason for a flag.
- FR-08 — Preserve the original source value.

Non-functional requirements

- NFR-01 — Explainability: users can understand why an observation was flagged.
- NFR-02 — Traceability: users can trace a result back to the relevant site/source record.
- NFR-03 — Data integrity: analytical treatment does not overwrite source values.

Example acceptance criterion

Given a record meets a defined exception criterion, when the analytical report is refreshed, then the record appears in the exception view with an understandable reason for the flag.

Prioritisation

MVP priority is the analytical exception-review capability. Operational case capture, workflow, notifications, AI and source correction remain out of scope unless validated requirements emerge.
